

Figure 8. Signed time interleaving is best, but not by 3 dB

Diagonal randomization plus time interleaving gives the best fast-drift ablation, but current tests refute the strong ≥ 3 dB gate.

Status: strong-claim refuted under current protocol

A Energy spreading

B Fast-drift fallback

M3 fast-drift fallback deltas					
rho	sigma_a	correction	srht_minus_ordered_db	best_alternative_minus_ordered_db	best_alternative
1	0.3	agc	0.083	0.141	sign_time_interleave
1	0.3	none	-0.009	0.05	sign_time_interleave
1	0.3	pairwise	-0.031	0.035	sign_time_interleave
1	0.3	scgi_proxy	-0.008	0.05	sign_time_interleave
10	0.3	agc	0.036	0.101	sign_time_interleave
10	0.3	none	-0.026	0.039	sign_time_interleave
10	0.3	pairwise	-0.043	0.027	sign_time_interleave
10	0.3	scgi_proxy	-0.025	0.039	sign_time_interleave

Energy concentration and fast-drift fallback-ablation evidence. Signed time interleaving is the best fast non-oracle alternative, but its advantage over ordered Hadamard remains only about 0.03-0.14 dB.
