

Figure 8. SRHT spreads energy but does not give a 3 dB fast-drift win

Diagonal randomization spreads coefficient energy; current fast-drift tests refute the strong full-SRHT advantage gate.

Status: strong-claim refuted under current protocol

A Energy spreading

B Fast-drift comparator

M3 fast-drift SRHT random comparator				
rho	sigma_a	srht_minus_ordered_db	srht_minus_best_random_db	best_srht_ablation
1	0.3	-0.009	0.19	sign_only
1	0.5	-0.008	0.082	sign_only
10	0.3	-0.003	0.02	sign_only
10	0.5	-0.004	0.016	sign_only

Energy concentration and fast-drift random-comparator evidence. Full SRHT is slightly above the best random basis in sampled fast cells, but it does not beat ordered Hadamard by the requested 3 dB margin.
